# Create a simple Contact List Android app

To demonstrate your technical skills in understanding Android SDK we ask you to create a simple Contact List application. It shows you the list of contacts and their details when you select them.

Requirements:
- Support Android 4.0+
- Support portrait and landscape screen orientation
- Use the list of people fetched live from http://jsonplaceholder.typicode.com/users
- Loading animation when fetching the list
- List can be sorted alphabetically (ascending & descending)

Feel free to use any third party libraries and don't worry too much about the exact coloring. How you code it is more important than the user interface.

Please send us your own work with the project file and source.
